User Stories

User Story 1

The user edits a page and is presented with a WYSIWYG Editor for editing the page wiki syntax. The user sees an editing area and a toolbar, which he can immediately recognize as being in front of and editable area.

User Story 2

The user wants to make some section of the text bold/italic/strikeout. He has two alternatives:

1. Selects the text (at least one character) and clicks the corresponding toolbar button (or key shortcut) and the selected text area becomes bold/italic/strikeout.
2. Doesn't select any text and clicks on the corresponding toolbar button (or key shortcut) and starts typing the text, when finished clicks again in the corresponding toolbar button (or key shortcut).

Usability Note: I will try to make these kind of functionality not to be mutually exclusive (so you can mix them up).

Tech Note: These kind of functionality will belong to a major "Usability Type", which some future additions like text coloring will belong.

User Story 3

The user wants to create a new paragraph so he just clicks the return key on his keyboard.

User Story 4

The user wants to create a new list (any type of list), he has two alternatives:

1. Selects the text (at least one character) or simply positions the caret in a piece of text and clicks on the corresponding toolbar button (or key shortcut) and the entire paragraph (or more than one if applicable, depending on the range of the selected text) becomes part of a list.
2. The caret is on an empty paragraph and the user clicks on the corresponding toolbar button (or key shortcut) and the current empty paragraph becomes a list, and the user starts typing the paragraph

User Story 5

The user wants to add a list item to an existing list: he positions the caret in the end of a list item and presses the Return button (like building a new paragraph) and the new list item will be entered under the that item.

User Story 6

The user wants to create a title, so he chooses from a list of available title types from a list (currently just one) and it is automatically applicable to the current paragraph.

User Story 7

The user types an URL (started with "http://") and the text automatically is considered a URL.

User Story 8

To create a link the user simply selects a piece of text, enters the link in the link field and presses the return key or clicks on the link button. To unlink just have to select a piece of text which is linked and erase the text in the editable link field or click the unlink button.
